Folgendes ist also die endgültige vollständige Herleitung. Darin sind α_3 und α_4 beliebige Typvariablen. Die in der Herleitung vorkommenden Typen τ und der Kontext Γ_3 sind durch $\tau := (\alpha_3 \to \alpha_4)$ und $\Gamma_3 := [f \mapsto ((\tau \to \tau) \to \tau), x \mapsto (\tau \to \tau)]$ definiert.

$$\frac{ \text{(VAR)}}{ \text{(APP)}} \frac{\overline{\Gamma_3[y \mapsto \alpha_3] \vdash f \colon ((\tau \to \tau) \to \tau)} \quad \text{(VAR)}}{\overline{\Gamma_3[y \mapsto \alpha_3] \vdash f \colon \tau}} \frac{\overline{\Gamma_3[y \mapsto \alpha_3] \vdash x \colon \tau \to \tau}}{ \text{(FN)}} \frac{ \text{(VAR)}}{\overline{\Gamma_3[y \mapsto \alpha_3]} \vdash f \colon x \colon \tau \to \tau} \quad \text{(VAR)} \frac{ \overline{\Gamma_3[y \mapsto \alpha_3] \vdash f \colon x \colon \tau \to \tau}}{ \overline{\Gamma_3 \vdash x \colon \tau \to \tau}} \frac{ \overline{\Gamma_3[y \mapsto \alpha_3] \vdash f \colon x \colon \tau \to \tau}}{ \overline{\Gamma_3 \vdash x \colon \text{(fun } y \to f \colon x y) \colon \tau}}$$

$$\frac{ \overline{\Gamma_3 \vdash x \colon \tau \to \tau}}{ \overline{\Gamma_3 \vdash x \colon \text{(fun } y \to f \colon x y) \colon \tau}} \frac{ \overline{\Gamma_3 \vdash x \colon \text{(fun } y \to f \colon x y) \colon \tau}}{ \overline{\Gamma_3 \vdash x \colon \text{(fun } y \to f \colon x y) \colon \tau}}$$

Beachten Sie, dass in einer Herleitung stets alle benuzten Typen und Kontexte konkret zu definieren sind. Man kann nicht τ , τ_1 , ... oder Γ verwenden, ohne diese konkret zu definieren.
